

1. **Colloids**: When the diameter of the particles of a substance dispersed in a solvent ranges from about 20 Å to 2000 Å then the system is termed as Colloid.
 2. **Dispersed Phase**: The substance is Distributed as Colloidal particles is called Dispersed Phase.
 3. **Dispersed Medium**: In which the colloidal particles dispersed.
 4. **Emulsion**: Liquid – Liquid Colloidal system is called Emulsion.
 5. **Adsorption Isotherm**: The relationship between the equilibrium pressure of a gas and its amount adsorbed on the solid adsorbent at any constant temperature is called adsorption isotherm.
-
6. **Rate of reaction**: The rate of reaction or simply reaction rate is the speed at which reactants are converted to product.
 7. **ZERO order**: The reaction whose rate is independent of the concentration of a reactant so that changing its concentration has no effect on speed of the reaction.
 8. **FIRST order**: The reaction whose rate is the proportional to first power of the concentration of one reactants.
 9. **SECOND order**: The reaction whose rate is the proportional to Second power of the concentration of one or two reactants.
 10. **PSEUDO UNIMOLECULAR**: Which seem to be second degree but actually a first order reaction.
-
11. **Electrolyte**: An electrolyte is a compound that conducts electric current when it is in Aqueous solution state.
 12. **Strong Electrolyte**: A strong electrolyte is a solution that completely ionizes or almost ionizes in a solution.
 13. **Weak Electrolyte**: A weak electrolyte is a solution that is not completely ionizes in a solution.
 14. **Conductance**: Conductance is the ability of an element to conduct electric current.
Conductance Expressed by G . $G = 1 / R$ Unit: Siemens (S).
 15. **Specific Conductance**: Specific conductivity (better known as conductivity) is the measure of the ability of that material to conduct electricity.
 16. **Equivalent Conductance**: Equivalent conductance is the conductance of an electrolyte measured after dissolving one gram equivalent in V cc of water.
 17. **Molar Conductance** : Molar conductivity is the conductance property of a solution containing one mole of the electrolyte.

18. **Transport Number:** The Fraction of total electric current carried by anion or cation is called transport number or Hitroff's number.
19. **Chemical Equilibrium:** Chemical equilibrium is the condition of a system where the concentrations of the reactants and products do not change with time. Also, the system does not show any change in its properties.
20. **Homogenous:** The chemical equilibrium in which the reactants and products are remain in the same state.
21. **Heterogeneous:** In which at least one product or reactant is in different physical state.
22. **Colligative properties:** Colligative properties are those properties of solution that depend on the ratio of the number of solute particles to the number of solvent particles in a solution.
23. **Ideal Solution:** The solution which obey ROULTS law at any temperature and pressure is called Ideal solution.
24. **Non Ideal solution:** A solution which shows deviation from Roults law is called non Ideal Solution.
25. **Henry's law:** The Mass of gas dissolved by a given volume of solvent at constant temperature is proportional to the pressure of the gas which it is in equilibrium. $W \propto V$
